

Bloom Health Product Requirements Document

Bloom Health — Product Requirements Document

Version: 1.0 **Prepared for:** Build agent (Antigravity) — target output: a single-file, mobile-first web app **Status:** Ready for build

1. Product Overview

Bloom Health is a mobile-first pregnancy companion app that helps expectant parents track daily activity, nutrition, and their pregnancy journey week-by-week. The product’s guiding philosophy is **Nurturing Minimalism** — a calm, uncluttered “digital sanctuary” that presents clinical/health data without feeling clinical, using heavy whitespace, soft color, and gentle interaction patterns to reduce cognitive load during a period of life that can feel overwhelming.

Primary persona: Sarah Miller, 31, currently Week 24 / Trimester 2, due Nov 15. She wants a quick daily glance at her progress (steps, water, calories), gentle nutrition suggestions, and a simple place to manage her profile and preferences.

Platform: Mobile web app (portrait, ~390–430px viewport), installed/opened full-screen (safe-area aware). Not desktop-first.

2. Brand & Design Philosophy

- **Nurturing Minimalism:** clean, intentional layouts with generous whitespace.
- **Soft Minimalism + Organic Tactility:** muted nature-inspired palette, generous padding, blob/organic decorative shapes, no harsh edges.
- **Forgiving interactions:** no aggressive transitions, no jarring color/motion cues. Scale-down (0.98x) or soft glow feedback instead of hard shadows.
- **Brand mark:** circular blush-pink badge containing a sage-green sprout cradled by a hand, paired with the wordmark “BLOOM” in sage green, uppercase, generous letter spacing (see logo asset).

3. Design System

Source of truth: `DESIGN.md` (Tailwind theme + brand doc). Reuse **exactly** — do not invent new tokens.

3.1 Color Tokens

Token	Hex	Usage
<code>primary</code>	<code>#4a654a</code>	Sage green — primary actions, progress, growth/health “success” states
<code>on-primary</code>	<code>#ffffff</code>	Text/icons on primary
<code>primary-container</code>	<code>#8ba889</code>	Filled icon chips, secondary emphasis
<code>on-primary-container</code>	<code>#243d25</code>	Text on primary-container
<code>primary-fixed</code> / <code>primary-fixed-dim</code>	<code>#ccebc8</code> / <code>#b0ceae</code>	Fixed-tone accents
<code>secondary</code>	<code>#7c5357</code>	Blush pink family — nurturing

		moments, emotional tracking
secondary-container	#fdc7cb	Tip cards, nurturing highlight backgrounds
on-secondary-container	#795154	Text on secondary-container
tertiary	#5f5e5a	Calming neutral accents (e.g. timers, sparklines)
tertiary-container	#a2a09b	Icon chip backgrounds
background / surface	#f6fbf4	App background (calming cream/off-white, not stark white)
surface-container-lowest	#ffffff	Elevated white cards (profile header, list rows)
surface-container-low	#f1f5ee	Section panels
surface-container	#ebefe8	Standard cards
surface-container-high / -highest	#e5e9e2 / #dfe4dd	Nested panels, track backgrounds
on-surface	#181d19	Primary text (deep charcoal green, not pure black)
on-surface-variant	#434841	Secondary/muted text, labels
outline / outline-variant	#737971 / #c3c8bf	Borders, dividers
error / error-container	#bala1a / #ffdad6	Destructive actions (Log Out)

Full token set (fixed/inverse variants) is defined in `DESIGN.md` — port the whole palette into the Tailwind config verbatim.

3.2 Typography

Style	Font	Size / Line-height	Weight	Use
Display LG	Plus Jakarta Sans	40/48, -0.02em	700	Hero numbers (e.g. “Week 24”, stat values)
Headline LG	Plus Jakarta Sans	32/40	600	Page/section headlines (desktop)
Headline LG (mobile)	Plus Jakarta Sans	28/36	600	Page headlines, profile name
Title MD	Plus Jakarta Sans	20/28	600	Card/section titles, nav header label
Body LG	Inter	18/28	400	Journey subcopy, meal descriptions
Body MD	Inter	16/24	400	Default body text, list rows
Label SM	Inter	13/18, +0.01em	500	Eyebrow labels, chip text, nav labels

Fonts loaded via Google Fonts (`Plus Jakarta Sans` , `Inter` , weights 100–900). Icons: **Material Symbols Outlined** (1.5–2px stroke, rounded terminals; filled variant only for “active” states like the tip lightbulb).

3.3 Spacing (8px base grid)

`unit` = 8px · `gutter` = 16px · `container-margin` = 24px · `stack-sm` = 8px · `stack-md` = 16px · `stack-lg` = 32px · `section-gap` = 48px.

Rule: cards/sections use 24px horizontal margin on mobile; major content blocks are separated by 48px+ vertical rhythm (“scrolling journal” feel).

3.4 Shape & Elevation

- Corner radius: cards/containers **16px** (`rounded-lg` → **custom `xl` / `3xl`** in practice, see screens which use `rounded-xl` / `rounded-2xl` / `rounded-3xl`); buttons **12px** or full pill for primary CTAs; chips/tags **full pill**.
- Elevation is **tonal**, not shadow-heavy: white/near-white surfaces on a cream base with very soft diffused shadows (blur 20px, 4% black opacity) — implemented in-code as low-opacity Tailwind `shadow-sm` / custom soft `rgba(0,0,0,0.02–0.04)` shadows.
- Interactive feedback: `active:scale-95` press states; no hover-lift on mobile.
- Decorative “ambient” blobs: large blurred low-opacity circles/organic SVG paths in `primary/5–20%` or `secondary-container/30%`, used behind hero and stat cards for softness — purely decorative, `pointer-events-none`.

3.5 Components (reusable, must be built as shared components/partials)

- **App Header** — fixed top, blurred translucent background, safe-area padding, left: logo (32px height) + page title (Title MD, primary color), right: 36px circular profile avatar (links to Profile).
- **Bottom Nav** — fixed, 5 items, blurred translucent background, safe-area padding, 80px height, icon (Material Symbols) + Label SM, active tab colored `primary`, inactive `on-surface-variant`.
- **Primary Button** — filled sage green, white text, pill or 12px radius, min 56px touch target, `active:scale-95`.
- **Secondary Button** — ghost style, sage-green border + text.
- **Stat/Metric Card** — `surface-container`, rounded-2xl/3xl, soft shadow, icon chip + Label SM eyebrow + Display/Headline value + unit + optional linear progress bar.
- **Linear Progress Bar** — track `surface-variant` / `surface-container-highest`, fill `primary` (or `secondary` for water), full pill, animates 0→value on mount (1000ms ease-out).
- **Circular Progress Ring** — thick stroke (8–12px SVG), rounded linecap, track = faint sage, active arc = full `primary`, center slot shows % + label (e.g. “60% There”).
- **Toggle Switch** — 48×24px pill track, 16px thumb, `primary` when on / `surface-container-highest` when off, thumb translates on toggle (JS class-swap, 200ms ease).
- **List Row (settings/account)** — `surface-container-lowest`, divided by 1px `surface-container` hairlines, left label (+ optional sublabel), right value/chevron/icon, tap ripple via hover/active background tint.
- **Expandable Panel** (“Adjust Goals”) — hidden by default, toggled via button, contains labeled range sliders (native `<input type=range>`, `accent-primary`) with live value readout.
- **Bar Chart (weekly)** — 7 equal-width columns, bar fill `primary` at varying opacity (10–100%) with the “today” bar fully solid + glow + bold label, value tooltip appears on hover/tap above each bar, X-axis day labels below.
- **Meal/Recommendation Card** — image banner (16:9-ish, ~128px height) with a floating pill badge top-left (“Next Meal”), below: title (Title MD), 2-line description, meta row (prep time, kcal) + circular add button.
- **Tip Card** — `secondary-container` background, blurred icon badge, title + body copy, decorative blurred blob accent.
- **Weekly Growth Visualizer** (referenced in *DESIGN.md*, not yet in prototypes — build as a stub component): organic blob shape sized/colored to represent fetal size comparison (e.g. “size of an ear of corn”), sage/blush palette.

4. Information Architecture / Navigation

Bottom tab bar, 5 destinations, persistent across all screens:

1. **Home** (`dashboard`) — Dashboard/overview (built)
2. **Activity** (`activity`) — steps/calories/weekly trend (built)
3. **Exercises** (`exercises`) — *not yet designed; build as placeholder/empty state matching design system*
4. **Nutrition** (`nutrition`) — *not yet designed; build as placeholder/empty state matching design system*
5. **Profile** (`profile`) — account, stats, preferences (built)

Header title changes per screen; profile avatar in the header always deep-links to the Profile tab.

5. Screen Specifications

5.1 Dashboard (Home)

Header title: “Dashboard”

Sections (top to bottom): 1. **Hero card** — rounded-[32px], `surface-container-low`, centered content, decorative low-opacity organic blob SVG behind content. - Headline: “Week {n}” (Display LG) - Subcopy: “Baby is the size of {comparison object}” (Body LG, muted) - Circular progress ring (192px), animates to {percent}% There (pregnancy completion = week/40), center label shows percent + “There” - Primary CTA button: “Log Journal Entry” (pill, sage fill) — opens journal entry flow (out of scope for this build; wire as a no-op / modal stub) 2. **Daily Goals grid** (2-col grid, `gutter` spacing) - **Steps card**: icon chip (primary-container), current/goal (e.g. 6,400 / 8k), thin progress bar - **Water card**: icon chip (secondary-container), current/goal in liters (e.g. 1.5 / 2.5 L), thin progress bar (secondary color) - **Active Calories card** (full width, span 2): icon chip (tertiary-container), kcal value + label, mini sparkline (SVG path, tertiary color) on the right 3. **Next Meal card** — food photo banner, “Next Meal” pill badge, meal title, 2-line benefit description, meta row (prep time, kcal), circular “+” add button (adds to daily log — stub action) 4. **Nurturing Tip card** — `secondary-container` background, lightbulb icon (filled), “Nurturing Tip” title + gentle advice copy. Content should rotate/vary by day (can be a static array cycled by day-of-year for the prototype).

5.2 Activity

Header title: “Activity”

Sections: 1. **Daily Progress card** — large stat block: “Steps” eyebrow, big number “6,420 / 8,000” (Display LG + Body MD), thick progress bar (16px, full pill), footer row: “{percent}% of daily goal” + “Adjust” pill button that toggles the goal-settings panel below. Decorative blurred circle top-right. 2. **Goal Settings panel** (collapsed by default, toggled by “Adjust”) — `surface-container-high`, contains two labeled range sliders: **Daily Steps** (3,000–15,000 step 500) and **Daily Calories** (100–800 kcal step 50), each with a live numeric readout bound via `oninput`. 3. **Stat pair grid** (2-col) — **Calories burned** card (kcal) and **Active minutes** card, both fixed height, icon top-right, big number + label. 4. **Last 7 Days card** — bar chart, 7 columns (Mon–Sun), bar height = relative step count, opacity scales with value, current day (e.g. Sat) rendered fully solid with a soft glow + bold axis label; per-bar value tooltip revealed on hover/tap.

Progress bar and bar-chart bars should animate in on load (start at 0/short, animate to true value over ~1s).

5.3 Profile

Header title: “Profile” (note: current prototype HTML has this mislabeled as “Activity” — fix during build)

Sections: 1. **Profile header** — centered, on `surface-container-lowest`: 128px circular avatar with a ring, small edit-photo button (bottom-right overlay, primary fill), name (Headline LG), status line “Week {n} • Trimester {n}” (Body LG, primary color). 2. **Your Journey card** — `surface-container-low`: header row (title + “Due: {date}” pill), full-width progress bar (week/40), footer labels “Week 1” / “Week 40”. 3. **Personal Stats section** — 2-col grid of stat tiles (`surface-container-lowest`, bordered, soft shadow): Weight (lbs), Height, and a full-width Age tile. 4. **Preferences section** — list card with: Daily Insights toggle row (with sublabel “Receive morning tips”), Language select row (chevron), Units select row (chevron). 5. **Account section** — list card with: Export Health Data (share icon), Privacy Policy (external-link icon), Log Out (error-colored, logout icon). 6. **Footer** — small grayscale, low-opacity Bloom logo, centered, purely decorative (non-interactive).

6. Assets

Asset	File	Notes
App logo	<code>logo.png</code> (uploaded)	Circular blush badge + sage sprout-in-hand mark + “BLOOM” wordmark. Use full lockup in marketing/footer contexts; consider a cropped icon-only version for the 32px header slot.
Default avatar	<code>profile-photo.png</code> (uploaded)	Placeholder headshot for the demo user “Sarah Miller” — used in header avatar and Profile hero.
Meal photo	remote URL in prototype	Replace with a licensed/self-hosted asset before production; keep aspect ratio ~2.4:1.

7. Technical Requirements

Deliverable: a **single self-contained HTML file** (as requested) implementing all 5 nav destinations as client-side “views” within one document — no page reloads, no build step required to preview.

Recommended stack (matches the existing prototypes): - **Tailwind CDN** (`cdn.tailwindcss.com`) with an inline `tailwind.config` block porting the full color/spacing/typography token set from `DESIGN.md` . - **Google Fonts**: Plus Jakarta Sans + Inter (variable weights). - **Material Symbols Outlined** for iconography. - **Vanilla JS** for: tab switching (show/hide view containers, update header title + active nav state), toggle switches, the Activity “Adjust Goals” panel, slider live-readouts, and on-mount progress animations (steps bar, journey bar, ring, weekly bars). - Mobile-first layout: `width: 100vw`, no body margin, `overscroll-behavior: none`, safe-area padding (`env(safe-area-inset-*)`) on fixed header/nav, `::-webkit-scrollbar { display: none }` . - Structure the single file as: one `<header>`, one `<nav>` (both fixed, shared across views), and one `<main>` containing five `<section data-view="dashboard|activity|exercises|nutrition|profile">` blocks toggled by a `showView(name)` JS function bound to the nav links. - Exercises and Nutrition views: build a lightweight placeholder consistent with the design system (e.g. centered icon + “Coming soon” Title MD text on `surface-container-low`) rather than leaving them broken.

Non-functional / acceptance criteria: - No horizontal scroll or layout shift at 375–430px viewport widths. - All interactive elements meet a 44px+ (ideally 56px for primary actions) touch target. - Animations are subtle (ease-out, $\leq 1000\text{ms}$) — no bouncing, no aggressive motion, consistent with “forgiving interactions.” - Color usage matches tokens exactly — no ad-hoc hex values outside the defined palette. - Header and bottom nav are fixed, translucent/blurred, and always reflect the currently active view. - Fully functional without a backend: use static/mock data matching the values shown in section 5 (steps, water, calories, weight/height/age, weekly bar data) stored as JS constants so they’re easy to swap for real data later.

8. Out of Scope (this build)

- Real authentication / data persistence
 - Journal entry flow (button should exist and be wired to a stub/modal only)
 - Exercises & Nutrition full feature builds (placeholders only)
 - Weekly Growth Visualizer illustration set (component stub only — one representative blob is sufficient for the prototype)
-

9. Build Instructions for the Agent (Antigravity)

1. Read this PRD and `DESIGN.md` in full before writing code.
2. Merge the three existing prototype screens (Dashboard, Activity, Profile) into **one HTML file** using the shared header/nav + `data-view` section pattern described in Section 7.
3. Fix the Profile header title bug (should read “Profile”, not “Activity”).
4. Build lightweight Exercises and Nutrition placeholder views so all 5 nav tabs are functional.
5. Preserve all existing visual details, copy, and interactions from the three source screens (Section 5) exactly — this PRD documents, not redesigns, the current prototypes.
6. Reuse the logo and profile photo assets provided.
7. Output a single `index.html` with no external build dependencies (CDN Tailwind + CDN fonts only).
